References Category:1947 births Category:Cranfield University alumni Category:Living people Category:Academics of Cranfield UniversitySex differences in the experience and management of chronic pelvic pain. The management of chronic pelvic pain (CPP) has been evaluated in several randomized controlled trials, but relatively little is known about the gender differences in the experience and management of CPP. This study aimed to determine if there are differences in the experience and management of CPP based on gender. A questionnaire was administered to a sample of men (n=22) and women (n=44) with long-term CPP (average duration of chronic pelvic pain >6 months). Participants were recruited through advertisements and were asked about the presence of a pain problem in the past and current month and were asked to describe current pain based on a visual analog scale. Participants were also asked about the management of their pain problem, including medical treatments for the current pain problem. There were no significant differences between men and women in the experience of pain problem; however, significantly more women (n=46/88%) than men (n=21/44%; p=
